

LOW PROFILE AGITATOR

Top View

High Efficiency Mode

The unique low profile agitator works well in either High Efficiency or Conventional Mode. In the High Efficiency mode the clothes have higher contact with the agitator due to the low water level, the agitator ensures a high level of clothes turnover.

Conventional Mode

In this mode the clothes are completely submerged in water and the curving steep side walls and raised shoulders of the wash plate vanes create enough inward and upward movement to keep the clothes turning over even when there is reduced contact with the agitator
